Website Security Test

What is an Website Security Test?

An Website Security Test is a manual assessment of the security of your web applications. Expert security consultants will analyse web applications to determine their vulnerability to attack from unauthorised users, and for the ability of valid users to perform unauthorised actions.

Why should I have a Website Security Test?

Regulations and standards such as: PCI, FSA, DPA and ISO 27001 are all in some way met by security testing. Web applications are inherently complex, and typically involve interaction with users and the exchange of personal information. They are also connected to internal systems such as databases, providing an attractive target for attack.

A Website Security Test will meet regulatory requirements, as well as improving your overall information security. It is also essential for systems carrying public sector information, and in particular personal information. Whilst you may not consider that you would be a target for a hacking attack from the internet, experience shows that hackers will exploit and publish vulnerabilities that they find to demonstrate their skills and expertise. Such an incident could have a damaging effect on the reputation of your company, and, if personal information is disclosed, lead to a fine or other regulatory action.

An Website Security Test will identify any weaknesses in the security of your web applications and demonstrate your commitment to information security governance.

Why should I use Activity?

Activity is recognised as a leading penetration test specialist in the UK. We invest in the training and development of our security experts ensuring that you benefit from the best security advice available.

We are members of CREST – the UK industry body for penetration testing companies, as well as being recognised by HM Government for public sector penetration testing by being members of the CESG CHECK scheme. Membership of both schemes provides you with independent confirmation of the quality and professionalism of our services.

What do I get?

Our experts will remotely test the security of your web application to identify any known security vulnerabilities. We will not perform any "denial of service" testing, but will report any vulnerability to such attacks that we find.

Any significant vulnerabilities will be reported to you on the day that they are found. All our findings will be presented in a written report, detailing any vulnerabilities found, our view of the risk that they pose to you, and recommended fixes to address them.

Whether you are considering your first Website Security Test or looking to review current providers, we can help: contact us to arrange a Service Review Call to understand your specific requirements and answer any questions you may have; we can then formulate a proposal for you. Please call or email your account manager.
